Do I need caching plugins and CDN?

CDN - Content Delivery Network · https://computancy.co.uk/kb/do-i-need-caching-plugins-in-addition-to-the-cdn/

The short answer is no, the Content Delivery Network takes care of caching for you. The CDN caches static content and stores it until it's purged via the **Edge Caching section in your site.**

This means you shouldn’t use any additional caching plugins such as W3 Total Cache or WP Super Cache.

In addition, we handle optimisation via the Website Acceleration Suite**.** The module improves website load times by automatically implementing web performance best practices to a website. This includes optimising images, JavaScript minification and combining CSS – all to improve website load times.

Therefore, you don’t need plugins such as WP Smush, Lazy Loading, EWWW Image Optimizer or Autoptimise.
